SAVE on Purchased Feed

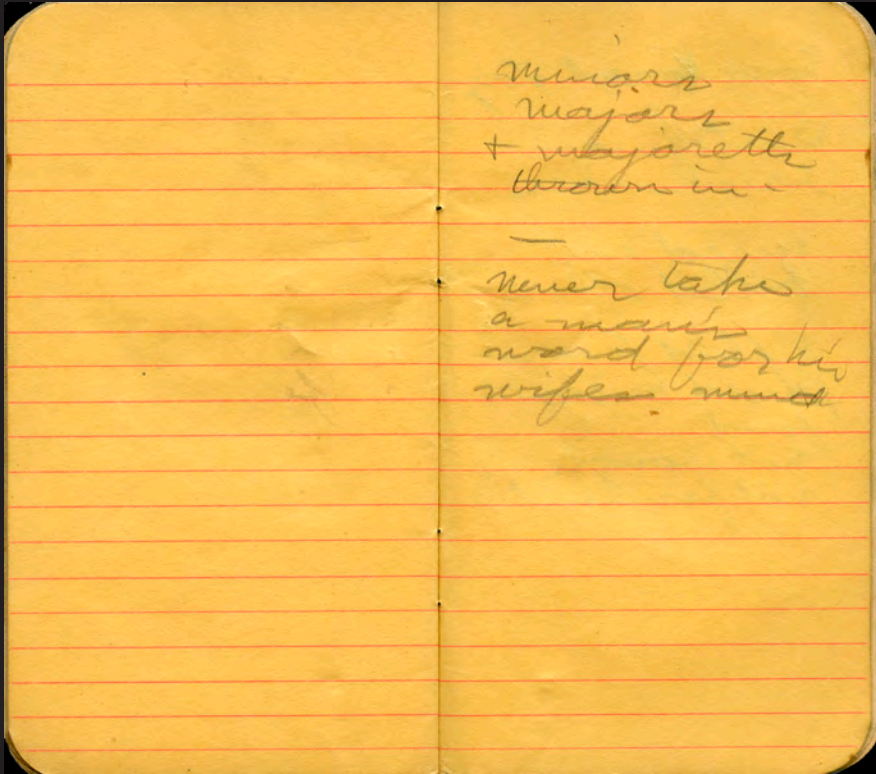

Top-Dress Your Pastures with 18% Normal

In these days of acute feed shortage, plan to reduce your grain purchases in 1944 by top-dressing your good pastures with lime, as needed, and Superphosphate . . . apply any time before the ground freezes. Use at least 600 lbs. of Superphosphate to the acre . . . a liberal application once every three years is better than small annual applications. This treatment will bring in native clovers to help furnish the Nitrogen and encourage larger yields of more palatable grasses. For best value, insist on 18% Normal Superphosphate.

Whenever you need Superphosphate
